# Содержание

# 1 Strategy.txt

- Проверить руками сэмплы
- Подумать как дебагать после написания
- Выписать сложные формулы и все +-1

- Проверить имена файлов
- Прогнать сэмплы
- Переполнения int, переполнения long long
- Выход за границу массива: _GLIBCXX_DEBUG
- Переполнения по модулю: в псевдо-онлайн-генераторе, в функциях-обертках
- Проверить мультитест на разных тестах
- Прогнать минимальный по каждому параметру тест
- Прогнать псевдо-максимальный тест(немного чисел, но очень большие или очень маленькие)
- Представить что не зайдет и заранее написать assert'ы, прогнать слегка модифицированные тесты
- cout.precision: в том числе в интерактивных задачах
- Удалить debug-output, отсечения для тестов, вернуть оригинальный maxn, удалить _GLIBCXX_DEBUG

- Вердикт может врать
- Если много тестов(>3), дописать в конец каждого теста ответ, чтобы не забыть
- (WA) Потестить не только ответ, но и содержимое значимых массивов, переменных
- (WA) Изменить тест так, чтобы ответ не менялся: поменять координаты местами, сжать/растянуть координаты, поменять ROOT дерева
- (WA) Подвигать размер блока в корневой или битсете
- (WA) Поставить assert'ы, возможно написать чекер с assert'ом
- (WA) Проверить, что программа не печатает что-либо неожиданное, что должно попадать под PE: inf - 2, не лекс. мин. решение, одинаковые числа вместо разных, неправильное количество чисел, пустой ответ, перечитать output format
- (TL) cin -> scanf -> getchar
- (TL) Упихать в кэш большие массивы, поменять местами for'ы или измерения массива
- (RE) Проверить формулы на деление на 0, выход за область определения(sqrt(-eps), acos(1 + eps))
- (WA) Проверить, что ответ влезает в int
